

# Backend Software Developer

**Taurine Technology** is a Cape Town startup building **Axon**, an AI-powered network management platform that gives providers deeper insight, better control and agentic workflows. Axon is hardware-agnostic, running on anything from a Raspberry Pi to a firewall at a fraction of the cost of traditional systems. Our customers range from schools running small networks to ISPs serving tens of thousands of subscribers.

Senior or mid-level position

Remote · Cape Town preferred

Python & Go

AI-native team

## THE ROLE

You'll own meaningful parts of the Axon controller, which turns millions of telemetry data points per site into insight and control. You'll also build the LLM tooling our agents use to classify traffic, troubleshoot and enforce policy, delivered over MCP.

- High-throughput telemetry ingestion under tight CPU, memory and disk budgets
- Systems resilient to unreliable links and offline devices, built for remote networks
- MCP integrations that let agents act autonomously while keeping operators in the loop
- New traffic intelligence features, from classification through to anomaly detection

## REQUIREMENTS

### Must haves

- Minimum 3–5 years building backend production systems
- Strong Python and Go abilities
- Strong understanding of network fundamentals: TCP/IP, DNS, VLANs, etc.
- Docker and Linux
- Fluent with AI dev tools, such as Claude Code, Codex, Cursor etc.

### Strong pluses

- Time-series data at volume (TimescaleDB or similar)
- Message-driven systems
- Software-defined networking, SNMP, OpenFlow/OVS
- Building tools for LLMs (MCP, function calling)
- Experience configuring network equipment

## HOW WE WORK

Small team, high ownership, short path from idea to production networks. We use AI coding agents aggressively, so you'll direct and review at least as much as you type. The code you write reaches customers within days.
